

School:

- Since I was a kid, I have loved building things, whether it's putting pieces of lego together or just playing with my electronics set where I used to create circuits connecting battery, switches, resistors, bulb and DC motor together to spin a small fan. This was something that I enjoyed the most during my childhood which sparked my interest in building things that are functional.
- This hobby of mine then developed more when I got introduced to robotics when I was in grade 8 where I learned about embedded programming using C and started working on a robotics project back in grade 9 using microcontrollers like ATmega328P.
- I mostly used to spend my time during free periods and after school hours at Robotics Lab where i used to tinker with all electronics equipment
- One of my favourite initial projects was a VRFPV Rover which was an Autonomous Rover Equipped with PIR Motion Sensor which was a pyroelectric device that detects motion by measuring changes in the infrared levels. Camera to provide First Person View in VR Headset, Ultrasonic Sensor and GPS. The Rover was designed for ranging and surveillance of Insurgent and Border areas This Project was selected in the Final Round of Innovation Challenge held at IIT Bombay
- embedded programming using microcontroller like ATmega328P
- Developed interest in robotics where i made various robotics project including an rover, drone where i got exposed to various sensors that can be used in robotics like ultrasonic sensor, gps, servos, piezoelectric, etc module and how i can integrate these a microcontroller to make a functioning prototypes of rover or a drone.
- What did I love the most in this process?

Building things from scratch and putting pieces together step by step was the process I enjoyed the most, connecting microcontroller to the sensor, designing a circuit on a breadboard and finally coding and debugging it to put life to the robot's skeleton i guess

In grade 11, I took up CS as an additional subject and started learning fundamentals of computer science, programming, SQL databases, etc.

The interest I developed to build things using computer programming and electronics hardware later pushed me to pursue Bachelor's of Technology in Computer Science Engineering
